**Abstract** – Aim of this paper is to introduce a new type of  $\alpha$ ws- $R_k$  spaces.

**Key words:**  $\alpha$ ws-  $R_k$  spaces

## INTRODUCTION

we introduce some new type of  $\alpha$ ws-spaces that is  $\alpha$ ws- $R_0$  spaces,  $\alpha$ ws- $R_1$  spaces by utilizing  $\alpha$ ws-closed and  $\alpha$ ws-open sets.

**Definition 1.1:** A space  $X$  is an  $\alpha$ ws- $R_0$  space if for every  $\alpha$ ws-open set contains the  $\alpha$ ws-closure of each of its points.

**Theorem 1.2:** A space  $X$  is an  $\alpha$ ws- $R_0$  space iff for every  $\alpha$ ws-closed set  $H$ ,  $\alpha$ ws-cl( $\{x\}$ )  $\cap H = \phi$  for all  $x \in X - H$ .

### Proof:

Suppose  $X$  is an  $\alpha$ ws- $R_0$  space. Let  $H$  be  $\alpha$ ws-closed set in  $X$ . Let  $x \in X - H$ . Therefore  $X - H$  is  $\alpha$ ws-open. Since  $X$  is an  $\alpha$ ws- $R_0$  space, by using Definition 1.1,  $\alpha$ ws-cl( $\{x\}$ )  $\subseteq X - H$  which implies that  $\alpha$ ws-cl( $\{x\}$ )  $\cap H = \phi$ . Conversely, suppose for every  $\alpha$ ws-closed set  $H$ ,  $\alpha$ ws-cl( $\{x\}$ )  $\cap H = \phi$  for every  $x \in X - H$ . To prove  $X$  is an  $\alpha$ ws- $R_0$  space. Let  $V$  be an  $\alpha$ ws-open set such that  $x \in V$ . Therefore  $X - V$  is  $\alpha$ ws-closed. By our assumption,  $\alpha$ ws-cl( $\{x\}$ )  $\cap (X - V) = \phi \Rightarrow \alpha$ ws-cl( $\{x\}$ )  $\subseteq V$ . Then by using Definition 1.1,  $X$  is an  $\alpha$ ws- $R_0$  space.

### Theorem 1.3:

The following two statements are equivalent

- i) The topological space  $X$  is an  $\alpha$ ws- $R_0$  space.
- ii)  $x \in \alpha$ ws-cl( $\{y\}$ ) iff  $y \in \alpha$ ws-cl( $\{x\}$ ) for any two points  $x$  and  $y$  in the topological space  $X$ .

**Proof:**

i)  $\Rightarrow$  ii)

Suppose  $X$  is an  $\alpha$ ws- $R_0$  space. Let  $x \in \alpha$ ws-cl  $(\{y\})$  and  $H$  be a  $\alpha$ ws-closed set containing  $x$ . Hence  $x \in \alpha$ ws-cl  $(\{y\}) \cap H$ . Assume that  $y \notin H \Rightarrow y \in X - H$ . Since  $X$  is  $\alpha$ ws- $R_0$ , by using Theorem 1.2,  $\alpha$ ws-cl  $(\{y\}) \cap H = \phi$ . This is a contradiction to the fact that the  $x \in \alpha$ ws-cl  $(\{y\}) \cap H$ . Therefore our assumption is wrong. Hence  $y \in H$ . Therefore, every  $\alpha$ ws-closed set containing  $x$  contains  $y \Rightarrow y \in \alpha$ ws-cl  $(\{x\})$ . Similarly if  $y \in \alpha$ ws-cl  $(\{x\})$ , then we can prove that  $x \in \alpha$ ws-cl  $(\{y\})$ .

ii)  $\Rightarrow$  i)

Suppose that  $x \in \alpha$ ws-cl  $(\{y\})$  iff  $y \in \alpha$ ws-cl  $(\{x\})$  for any two points  $x$  and  $y$  in  $X$ . To prove that  $X$  is an  $\alpha$ ws- $R_0$  space. Assume  $U$  is an  $\alpha$ ws-open set and  $x \in U$ . Take  $y \in \alpha$ ws-cl  $(\{x\})$ . By our assumption  $x \in \alpha$ ws-cl  $(\{y\})$ . If  $y \notin U$ , then  $y \in X - U$ . Since  $U$  is  $\alpha$ ws-open,  $X - U$  is  $\alpha$ ws-closed and  $x \notin X - U$ . That is  $x \notin \alpha$ ws-cl  $(\{y\})$ , which is a contradiction to the fact that  $x \in \alpha$ ws-cl  $(\{y\})$ . Hence  $y \in U$  and  $\alpha$ ws-cl  $(\{x\}) \subseteq U$ . Then by using Definition 1.1,  $X$  is an  $\alpha$ ws- $R_0$  space.

**Definition 1.4:**

- i) The intersection of all  $\alpha$ ws-open subsets of  $(X, \tau)$  containing  $A$  is called  $\alpha$ ws-kernel of  $A$  (briefly,  $\alpha$ ws-ker( $A$ )) That is,  $\alpha$ ws-ker( $A$ ) =  $\cap \{ U : U \in \alpha$ WSO( $X, \tau$ ) and  $A \subseteq U \}$
- ii) Let  $x \in X$ , then  $\alpha$ ws-kernel of  $x$  is denoted by  $\alpha$ ws-ker( $x$ ) =  $\cap \{ U : U \in \alpha$ WSO( $X, \tau$ ) and  $x \in U \}$ .

**Proposition 1.5:**

Let us consider  $X$  be a topological space and let  $A$  and  $B$  be subsets of  $X$  then

- i)  $A \subseteq \alpha$ ws-ker( $A$ )
- ii) If  $A \subseteq B$  then  $\alpha$ ws-ker ( $A$ )  $\subseteq$   $\alpha$ ws-ker( $B$ )
- iii)  $\alpha$ ws-ker ( $\alpha$ ws-ker( $A$ )) =  $\alpha$ ws-ker( $A$ )
- iv) If  $A$  is  $\alpha$ ws-open then  $A = \alpha$ ws-ker( $A$ ).

**Proof:**

Clearly (i) and (ii) follows from the definition of  $\alpha$ ws-kernel.

iii) By using (i)  $\alpha$ ws-ker( $A$ )  $\subseteq$   $\alpha$ ws-ker( $\alpha$ ws-ker( $A$ )). Let  $x \in \alpha$ ws-ker ( $\alpha$ ws-ker( $A$ )).

Therefore every  $\alpha$ ws-open set containing  $\alpha$ ws-ker ( $A$ ) contains  $x$ . Let  $U$  be an  $\alpha$ ws-open set containing  $A$ . Therefore  $\alpha$ ws-ker ( $A$ )  $\subseteq U$  and  $x \in U$ . Thus every  $\alpha$ ws-open set containing  $A$  contains  $x$ . Thus  $x \in \alpha$ ws-ker ( $A$ ). Therefore,  $\alpha$ ws-ker ( $\alpha$ ws-ker ( $A$ ))  $\subseteq$   $\alpha$ ws-ker ( $A$ ). Hence  $\alpha$ ws-ker( $A$ ) =  $\alpha$ ws-ker ( $\alpha$ ws-ker ( $A$ )).

iv) Let  $A$  be any subset of  $X$ . We know that  $\alpha$ ws-ker ( $A$ )  $\subseteq A$ . By using (i), we get  $\alpha$ ws-ker ( $A$ ) =  $A$ .

**Proposition 1.6:**

Let  $x$  and  $y$  be any two points in a space  $X$ . Then  $y \in \alpha\text{ws-ker}(x)$  iff  $x \in \alpha\text{ws-cl}(\{y\})$

**Proof:**

Let  $y \in \alpha\text{ws-ker}(x)$ . To prove  $x \in \alpha\text{ws-cl}(\{y\})$ . If  $x \notin \alpha\text{ws-cl}(\{y\})$ , then there is an  $\alpha\text{ws-closed}$  set  $F$  such that  $y \in F$  and  $x \notin F$ . Since  $F$  is an  $\alpha\text{ws-closed}$  set,  $X - F$  is an  $\alpha\text{ws-open}$  set containing  $x$ . Now,  $y \notin X - F = \alpha\text{ws-ker}(\{x\})$ , because  $y \in F$ . This is a contradiction, because  $y \in \alpha\text{ws-ker}(\{x\})$ . Thus  $x \in \alpha\text{ws-cl}(\{y\})$ . Conversely, suppose that  $x \in \alpha\text{ws-cl}(\{y\})$ . To prove  $y \in \alpha\text{ws-ker}(\{x\})$ . Suppose not,  $y \notin \alpha\text{ws-ker}(\{x\})$  then there is an  $\alpha\text{ws-open}$  set  $U$  such that  $x \in U$  and  $y \notin U \Rightarrow x \notin X - U$  and  $X - U$  is an  $\alpha\text{ws-closed}$  set containing  $y$ . That is,  $x \notin \alpha\text{ws-cl}(\{y\})$ , which is a contradiction to the fact that  $x \in \alpha\text{ws-cl}(\{y\})$ . Therefore  $y \in \alpha\text{ws-ker}(\{x\})$ .

**Theorem 1.7:**

For any two points  $x, y$  in  $X$  then following two are equivalent

- i)**  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$    **ii)**  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$

**Proof:**

**i)  $\Rightarrow$  ii)**

Assume that  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$ . Then there is a point  $z \in X$  such that  $z \in \alpha\text{ws-ker}(\{x\})$  and  $z \notin \alpha\text{ws-ker}(\{y\})$  or  $z \notin \alpha\text{ws-ker}(\{x\})$  and  $z \in \alpha\text{ws-ker}(\{y\})$ . Consider the first case. we have  $x \in \alpha\text{ws-cl}(\{z\})$  and  $y \notin \alpha\text{ws-cl}(\{z\})$ . Since  $y \notin \alpha\text{ws-cl}(\{z\})$ , there exists an  $\alpha\text{ws-closed}$  set  $H$  such that  $z \in H$  and  $y \notin H$ . Since  $x \in \alpha\text{ws-cl}(\{z\})$ ,  $x \in H$ . here  $y \notin H$  and  $x \in H \Rightarrow y \notin \alpha\text{ws-cl}(\{x\})$ . Obviously  $y \in \alpha\text{ws-cl}(\{y\})$ . Therefore  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$ . Similarly we prove that second case.

**ii)  $\Rightarrow$  i)** Suppose that  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$ . To prove  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$ . Then there is a point  $z \in X$  such that  $z \in \alpha\text{ws-cl}(\{x\})$  and  $z \notin \alpha\text{ws-cl}(\{y\})$  or  $z \notin \alpha\text{ws-cl}(\{x\})$  and  $z \in \alpha\text{ws-cl}(\{y\})$ . Considering the first case. By using Proposition 1.6, we have  $x \in \alpha\text{ws-ker}(\{z\})$  and  $y \notin \alpha\text{ws-ker}(\{z\})$ . Since  $y \notin \alpha\text{ws-ker}(\{z\})$ , there exists an  $\alpha\text{ws-open}$  set  $G$  such that  $z \in G$  and  $y \notin G$ . Since  $x \in \alpha\text{ws-ker}(\{z\})$ , there exists an  $\alpha\text{ws-open}$  set  $G$  such that  $x \in G$ . Now,  $y \notin G$ ,  $x \in G \Rightarrow y \notin \alpha\text{ws-ker}(\{x\})$ . Obviously  $y \in \alpha\text{ws-ker}(\{y\})$ . Hence  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$ . Similarly we prove the second case.

**Theorem 1.8:**

A space  $X$  is an  $\alpha\text{ws-R}_0$  space iff for any  $x \in X$ ,  $\alpha\text{ws-cl}(\{x\}) = \alpha\text{ws-ker}(\{x\})$ .

**Proof:**

Let  $X$  be an  $\alpha\text{ws-R}_0$  space. First we prove that  $\alpha\text{ws-cl}(\{x\}) \subseteq \alpha\text{ws-ker}(\{x\})$ . Let  $y \in \alpha\text{ws-cl}(\{x\})$ . If  $y \notin \alpha\text{ws-ker}(\{x\})$ , then there exists an  $\alpha\text{ws-open}$  set  $U$  such that  $x \in U$  and  $y \notin U$ . since  $U$  is an  $\alpha\text{ws-open}$  set,  $X - U$  is an  $\alpha\text{ws-closed}$  set. Since  $X$  is an  $\alpha\text{ws-R}_0$  space, by using Theorem 1.2,  $\alpha\text{ws-cl}(\{x\}) \cap (X - U) = \emptyset$ . This is a contradiction to the fact that  $y \in$

$\alpha\text{ws-cl}(\{x\}) \cap (X - U) \Rightarrow y \in \alpha\text{ws-ker}(\{x\})$ . Thus  $\alpha\text{ws-cl}(\{x\}) \subseteq \alpha\text{ws-ker}(\{x\})$ . On the other hand, to prove  $\alpha\text{ws-ker}(\{x\}) \subseteq \alpha\text{ws-cl}(\{x\})$ . Let  $y \in \alpha\text{ws-ker}(\{x\})$ . By using Proposition 1.6,  $x \in \alpha\text{ws-cl}(\{y\})$ . By using Theorem 1.3,  $y \in \alpha\text{ws-cl}(\{x\})$ . Thus  $\alpha\text{ws-ker}(\{x\}) \subseteq \alpha\text{ws-cl}(\{x\})$ . Therefore  $\alpha\text{ws-cl}(\{x\}) = \alpha\text{ws-ker}(\{x\})$ . Conversely, suppose that for any  $x \in X$ ,  $\alpha\text{ws-cl}(\{x\}) = \alpha\text{ws-ker}(\{x\})$ . To prove that  $X$  is an  $\alpha\text{ws-R}_0$  space. Let  $U$  be  $\alpha\text{ws}$ -open set in  $X$  such that  $x \in U$ . Therefore  $\alpha\text{ws-cl}(\{x\}) = \alpha\text{ws-ker}(\{x\}) = \cap \{G : G \in \alpha\text{WSO}(X) \text{ and } \{x\} \subseteq G \subseteq U\}$ . Then by using Definition 1.1,  $X$  is an  $\alpha\text{ws-R}_0$  space.

**Corollary 1.9:**

If a space  $X$  is an  $\alpha\text{ws-R}_0$  space, then for any  $\alpha\text{ws}$ -closed set  $H$  in  $X$ ,  $\alpha\text{ws-ker}(\{x\}) \cap H = \phi$  for all  $x \in X - H$ .

**Proof:**

Suppose that  $X$  is an  $\alpha\text{ws-R}_0$  space. Let  $H$  be an  $\alpha\text{ws}$ -closed set in  $X$ . By using Theorem 1.2,  $\alpha\text{ws-cl}(\{x\}) \cap H = \phi$  for all  $x \in X - H$ . By using Theorem 1.8,  $\alpha\text{ws-ker}(\{x\}) \cap H = \phi$  for all  $x \in X - H$ .

**Theorem 1.10:**

A space  $X$  is an  $\alpha\text{ws-R}_0$  space iff for every  $\alpha\text{ws}$ -closed set  $H$  and  $x \in H$ ,  $\alpha\text{ws-ker}(\{x\}) \subseteq H$ .

**Proof:**

Let us assume that  $X$  be an  $\alpha\text{ws-R}_0$  space. To prove that  $\alpha\text{ws-ker}(\{x\}) \subseteq H$ . Let  $H$  be any  $\alpha\text{ws}$ -closed set in  $X$ . Let  $x \in H$ . Thus  $\alpha\text{ws-cl}(\{x\}) \subseteq H$ . By using Theorem 1.8,  $\alpha\text{ws-ker}(\{x\}) \subseteq H$ . Conversely, assume  $\alpha\text{ws-ker}(\{x\}) \subseteq H$ , for every  $\alpha\text{ws}$ -closed set in  $H$  and  $x \in H$ . Let  $V$  be an  $\alpha\text{ws}$ -open set and  $x \in V$ . If  $y \in \alpha\text{ws-cl}(\{x\})$ , then by using Proposition 1.6,  $x \in \alpha\text{ws-ker}(\{y\})$ . If  $y \notin V$ , then  $y \in X - V$  and  $X - V$  is  $\alpha\text{ws}$ -closed set. By using assumption,  $\alpha\text{ws-ker}(\{y\}) \subseteq X - V$ . Since  $x \in \alpha\text{ws-ker}(\{y\})$ ,  $x \in X - V$  and so  $x \notin V$ , which is a contradiction to the fact that  $x \in V$ . Hence  $y \in V$  and  $\alpha\text{ws-cl}(\{x\}) \subseteq V$ . Then by using Definition 1.1,  $X$  is an  $\alpha\text{ws-R}_0$  space.

**Theorem 1.11:**

A topological spaces  $X$  is an  $\alpha\text{ws-R}_0$  space iff for any two points  $x, y \in X$ ,  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$  implies  $\alpha\text{ws-cl}(\{x\}) \cap \alpha\text{ws-cl}(\{y\}) = \phi$ .

**Proof:**

Suppose  $X$  is an  $\alpha\text{ws-R}_0$  space. To prove  $\alpha\text{ws-cl}(\{x\}) \cap \alpha\text{ws-cl}(\{y\}) = \phi$ . Let us assume  $x, y \in X$  such that  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$ . Then there exists an  $z \in X$  such that  $z \in \alpha\text{ws-cl}(\{x\})$  and  $z \notin \alpha\text{ws-cl}(\{y\})$  or  $z \notin \alpha\text{ws-cl}(\{x\})$  and  $z \in \alpha\text{ws-cl}(\{y\})$ . Considering the first case, then there exists an  $\alpha\text{ws}$ -closed set in  $F$  such that  $y \in F$  and  $z \notin F$ . Now every  $\alpha\text{ws}$ -closed set containing  $x$  contains  $z$ , because  $z \in \alpha\text{ws-cl}(\{x\})$ . Thus  $x \notin F$  and  $x \in X - F$ . Now,  $y \in F \Rightarrow \alpha\text{ws-cl}(\{y\}) \subseteq F$ . Hence  $\alpha\text{ws-cl}(\{x\}) \cap \alpha\text{ws-cl}(\{y\}) \subseteq \alpha\text{ws-cl}(\{x\}) \cap F = \phi$ . By Theorem 1.2, the proof of

the second case is similar to the first case. Conversely, suppose for any two points  $x, y \in X$ ,  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\}) \implies \alpha\text{ws-cl}(\{x\}) \cap \alpha\text{ws-cl}(\{y\}) = \phi$ . To prove  $X$  is an  $\alpha\text{ws-R}_0$  space. Let  $V$  be an  $\alpha\text{ws-open}$  set and  $x \in V$ . Assume  $y \in \alpha\text{ws-cl}(\{x\})$ . If  $y \notin V$ , then  $y \in X - V$ . Since  $x \in V$ ,  $x \notin X - V$  and  $X - V$  is  $\alpha\text{ws-closed}$ . Thus  $x \notin \alpha\text{ws-cl}(\{y\})$ . Since  $x \in \alpha\text{ws-cl}(\{x\})$ ,  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$ . By our assumption,  $\alpha\text{ws-cl}(\{x\}) \cap \alpha\text{ws-cl}(\{y\}) = \phi$ . Thus  $y \notin \alpha\text{ws-cl}(\{x\})$  which is a contradiction to  $y \in \alpha\text{ws-cl}(\{x\})$ . Therefore,  $y \in V$  and  $\alpha\text{ws-cl}(\{x\}) \subseteq V$ . Hence  $X$  is  $\alpha\text{ws-R}_0$ .

**Theorem 1.12:**

A topological spaces  $X$  is an  $\alpha\text{ws-R}_0$  space iff for any two points  $x, y \in X$ ,  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$  implies  $\alpha\text{ws-ker}(\{x\}) \cap \alpha\text{ws-ker}(\{y\}) = \phi$ .

**Proof:**

Given that Suppose  $X$  is an  $\alpha\text{ws-R}_0$  space. To prove  $\alpha\text{ws-ker}(\{x\}) \cap \alpha\text{ws-ker}(\{y\}) = \phi$ . Let us assume  $x, y \in X$  such that  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$ . By Theorem 1.7,  $\alpha\text{ws-cl}(\{x\}) \neq \alpha\text{ws-cl}(\{y\})$ . By Theorem 1.10,  $\alpha\text{ws-cl}(\{x\}) \cap \alpha\text{ws-cl}(\{y\}) = \phi$ . Since  $X$  is  $\alpha\text{ws-R}_0$ , by Theorem 1.7,  $\alpha\text{ws-ker}(\{x\}) \cap \alpha\text{ws-ker}(\{y\}) = \phi$ . Conversely, assume that two points  $x, y \in X$ ,  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$  implies  $\alpha\text{ws-ker}(\{x\}) \cap \alpha\text{ws-ker}(\{y\}) = \phi$ . To prove  $X$  is an  $\alpha\text{ws-R}_0$  space. Let  $H$  be an  $\alpha\text{ws-closed}$  set and  $x \in H$ . Assume  $y \in \alpha\text{ws-ker}(\{x\})$ . If  $y \notin H \implies y \in X - H$  and  $X - H$  is  $\alpha\text{ws-open}$  and  $x \notin X - H$ . Hence  $x \notin \alpha\text{ws-ker}(\{y\})$ . Since  $x \in \alpha\text{ws-ker}(\{x\})$ ,  $\alpha\text{ws-ker}(\{x\}) \neq \alpha\text{ws-ker}(\{y\})$ . By assumption,  $\alpha\text{ws-ker}(\{x\}) \cap \alpha\text{ws-ker}(\{y\}) = \phi$ . Thus  $y \notin \alpha\text{ws-ker}(\{x\})$ , which is a contradiction to the fact that  $y \in \alpha\text{ws-ker}(\{x\})$ . Thus  $y \in H$  and  $\alpha\text{ws-ker}(\{x\}) \subseteq H$ . By Theorem 1.10,  $X$  is an  $\alpha\text{ws-R}_0$  space.

**Theorem 1.13:**

A space  $X$  is  $\alpha\text{ws-R}_0$  iff for each  $\alpha\text{ws-closed}$  set  $F$  and  $x \notin F$ , there is an  $\alpha\text{ws-open}$  set  $U$  such that  $F \subseteq U$ ,  $x \notin U$ .

**Proof:**

Let us assume  $X$  be an  $\alpha\text{ws-R}_0$  space and  $F$  be an  $\alpha\text{ws-closed}$  set in  $X$  that does not containing the point  $x$ . Therefore  $X - F$  is  $\alpha\text{ws-open}$  and  $x \in X - F$ . Since  $X$  is an  $\alpha\text{ws-R}_0$ , by using Definition 1.1,  $\alpha\text{ws-cl}(\{x\}) \subseteq X - F$ . This implies  $F \subseteq X - \alpha\text{ws-cl}(\{x\})$ . Let  $U = X - \alpha\text{ws-cl}(\{x\})$ . Therefore  $U$  is an  $\alpha\text{ws-open}$  set such that  $F \subseteq U$  and  $x \notin U$ . Conversely, suppose that  $F$  is an  $\alpha\text{ws-closed}$  set and  $x \notin F$ , there is an  $\alpha\text{ws-open}$  set  $U$  such that  $F \subseteq U$ ,  $x \notin U$ . Let us assume  $G$  be an  $\alpha\text{ws-open}$  set such that  $x \in G$ . Therefore  $X - G$  is an  $\alpha\text{ws-closed}$  set and  $x \notin X - G$ . By using hypothesis, there exists an  $\alpha\text{ws-open}$  set  $U$  such that  $X - G \subseteq U$  and  $x \notin U \implies X - U \subseteq G$  and  $x \in X - U$ . Thus  $\alpha\text{ws-cl}(\{x\}) \subseteq X - U \subseteq G$ . Then by using Definition 1.1,  $X$  is an  $\alpha\text{ws-R}_0$  space.

**Definition 1.14:**

A topological space  $X$  is an  $\alpha$ ws- $R_1$  space if for any  $x, y \in X$  with  $\alpha$ ws-cl( $\{x\}$ )  $\neq$   $\alpha$ ws-cl( $\{y\}$ ), there exist disjoint  $\alpha$ ws-open sets  $U$  and  $V$  such that  $\alpha$ ws-cl( $\{x\}$ )  $\subseteq U$  and  $\alpha$ ws-cl( $\{y\}$ )  $\subseteq V$ .

**Theorem 1.15:**

If a space  $X$  is an  $\alpha$ ws- $R_1$  space, then for any  $x, y \in X$  with  $\alpha$ ws-ker( $\{x\}$ )  $\neq$   $\alpha$ ws-ker( $\{y\}$ ), there exist disjoint  $\alpha$ ws-open sets  $U$  and  $V$  such that  $\alpha$ ws-ker( $\{x\}$ )  $\subseteq U$  and  $\alpha$ ws-ker( $\{y\}$ )  $\subseteq V$ .

**Proof:**

Assume that  $X$  is an  $\alpha$ ws- $R_1$  space. Let  $x, y \in X$  with  $\alpha$ ws-ker( $\{x\}$ )  $\neq$   $\alpha$ ws-ker( $\{y\}$ ). By using Theorem 1.7,  $\alpha$ ws-cl( $\{x\}$ )  $\neq$   $\alpha$ ws-cl( $\{y\}$ ). Since  $X$  is an  $\alpha$ ws- $R_1$  space, by using Definition 1.14, there exists disjoint  $\alpha$ ws-open sets  $U$  and  $V$  such that  $\alpha$ ws-cl( $\{x\}$ )  $\subseteq U$  and  $\alpha$ ws-cl( $\{y\}$ )  $\subseteq V$ . Since  $U$  and  $V$  are  $\alpha$ ws-open sets,  $\alpha$ ws-ker( $\{x\}$ )  $\subseteq U$  and  $\alpha$ ws-ker( $\{y\}$ )  $\subseteq V$ .

**Proposition 1.16:**

If  $X$  is  $\alpha$ ws- $R_1$ , then it is an  $\alpha$ ws- $R_0$  space.

**Proof:**

Given that  $X$  is an  $\alpha$ ws- $R_1$  space. Let  $U$  be an  $\alpha$ ws-open set such that  $x \in U$ . suppose  $\alpha$ ws-cl( $\{x\}$ )  $\not\subseteq U$ . There exists  $y \in X$  such that  $y \in \alpha$ ws-cl( $\{x\}$ ) and  $y \notin U$ . Since  $x \notin X - U$  and since  $X - U$  is an  $\alpha$ ws-closed set containing  $y$ ,  $x \notin \alpha$ ws-cl( $\{y\}$ ). Therefore,  $\alpha$ ws-cl( $\{x\}$ )  $\neq$   $\alpha$ ws-cl( $\{y\}$ ). Since  $X$  is an  $\alpha$ ws- $R_1$  space, by using Definition 1.14, there exists disjoint  $\alpha$ ws-open set  $G$  and  $V$  such that  $\alpha$ ws-cl( $\{x\}$ )  $\subseteq G$  and  $\alpha$ ws-cl( $\{y\}$ )  $\subseteq V$  and  $x \notin V$ . Now,  $x \in X - V$  and  $X - V$  is an  $\alpha$ ws-closed and  $y \notin X - V \Rightarrow y \notin \alpha$ ws-cl( $\{x\}$ ) which is a contradiction. Thus  $\alpha$ ws-cl( $\{x\}$ )  $\subseteq U$ . Therefore,  $X$  is an  $\alpha$ ws- $R_1$  space.

**Theorem 1.17:**

If a space  $X$  is both  $\alpha$ ws- $T_0$  and  $\alpha$ ws- $R_0$  then  $X$  is an  $\alpha$ ws- $T_1$ .

**Proof:**

Suppose that  $X$  is both  $\alpha$ ws- $T_0$  and  $\alpha$ ws- $R_0$ . Let  $x, y \in X$ . Since  $X$  is  $\alpha$ ws- $T_0$ , there exists an  $\alpha$ ws-open set  $G$  such that  $x \in G$  and  $y \notin G$ . Since  $X$  is  $\alpha$ ws- $R_0$ , by using Definition 1.1,  $\alpha$ ws-cl( $\{x\}$ )  $\subseteq G$ . Now  $y \notin \alpha$ ws-ker( $\{x\}$ ), because  $y \notin G$ . Since  $X$  is  $\alpha$ ws- $R_0$ , by using Theorem 1.8,  $y \notin \alpha$ ws-cl( $\{x\}$ ). Hence  $y \in X - \alpha$ ws-cl( $\{x\}$ ) and  $x \notin X - \alpha$ ws-cl( $\{x\}$ ). Suppose take  $H = X - \alpha$ ws-cl( $\{x\}$ ). Thus  $y \in H$  and  $x \notin H$ . Also  $H$  is  $\alpha$ ws-open in  $X$ . Hence there exists disjoint  $\alpha$ ws-open sets  $G$  and  $H$  such that  $x \in G$  but  $y \notin G$  and  $x \notin H$  but  $y \in H$ . Hence  $X$  is an  $\alpha$ ws- $T_1$  space.
